

<b>PALOMAR ENERGY PROJECT (01-AFC-24)</b> <b>CEC STAFF DATA REQUEST NUMBER 75</b>	
<b>Technical Area: Visual Resources</b>	<b>Response Date: April 8, 2002</b>

**REQUEST:**

Please identify the number of residences that would have views of the pipeline route during construction and the proximity of those residences to the route.

---

**RESPONSE:**

There are seven single-family residences on Metcalf Street along the natural gas line route, as well as several multi-family units. The multi-family units include an 80-unit condominium complex, as well as a roughly 20-unit apartment building and three 2 to 6-unit apartments. Roughly 15 of the residences of the 80-unit complex front on Lincoln Street and thus would have a view of the construction activities, as do approximately 10 of the other apartment units. There are four single-family residences on Lincoln Avenue near the Metcalf intersection.

In summary, there are 11 single-family residences and approximately 30 multi-family units fronting on the two streets within which the gas pipeline upgrade would be installed. These are the primary residences that would have direct views of the construction work for the short time work will be going on in their vicinity. Behind these dwelling units closest to the street, there also are another roughly 80 dwelling units set back from the street (behind the units fronting on the street) along these same two blocks. These 80 units will have very limited, if any, direct views of the pipeline installation work.
